**City of Toronto Airshed Modelling  
Ontario Section Annual Conference  
6 October 2010**

# Outline

- Background
- Purpose of Study
- Accomplishments
  - List of PAC's
  - Emissions
  - Meteorology
  - Neighborhood assessments
- Results to-date

## Background

- ❑ Toronto is Canada's largest city
  - Population of about 2.6 million people
  - 44 wards
  - 140 Neighbourhoods
  
- ❑ Maximum north-south distance of 21 kilometres & a maximum east-west distance of 43 km.
  
- ❑ MOH identified air quality as a growing concern that community residents are exposed to
  
- ❑ Recommended that a “ study of cumulative air quality impacts ... be completed”

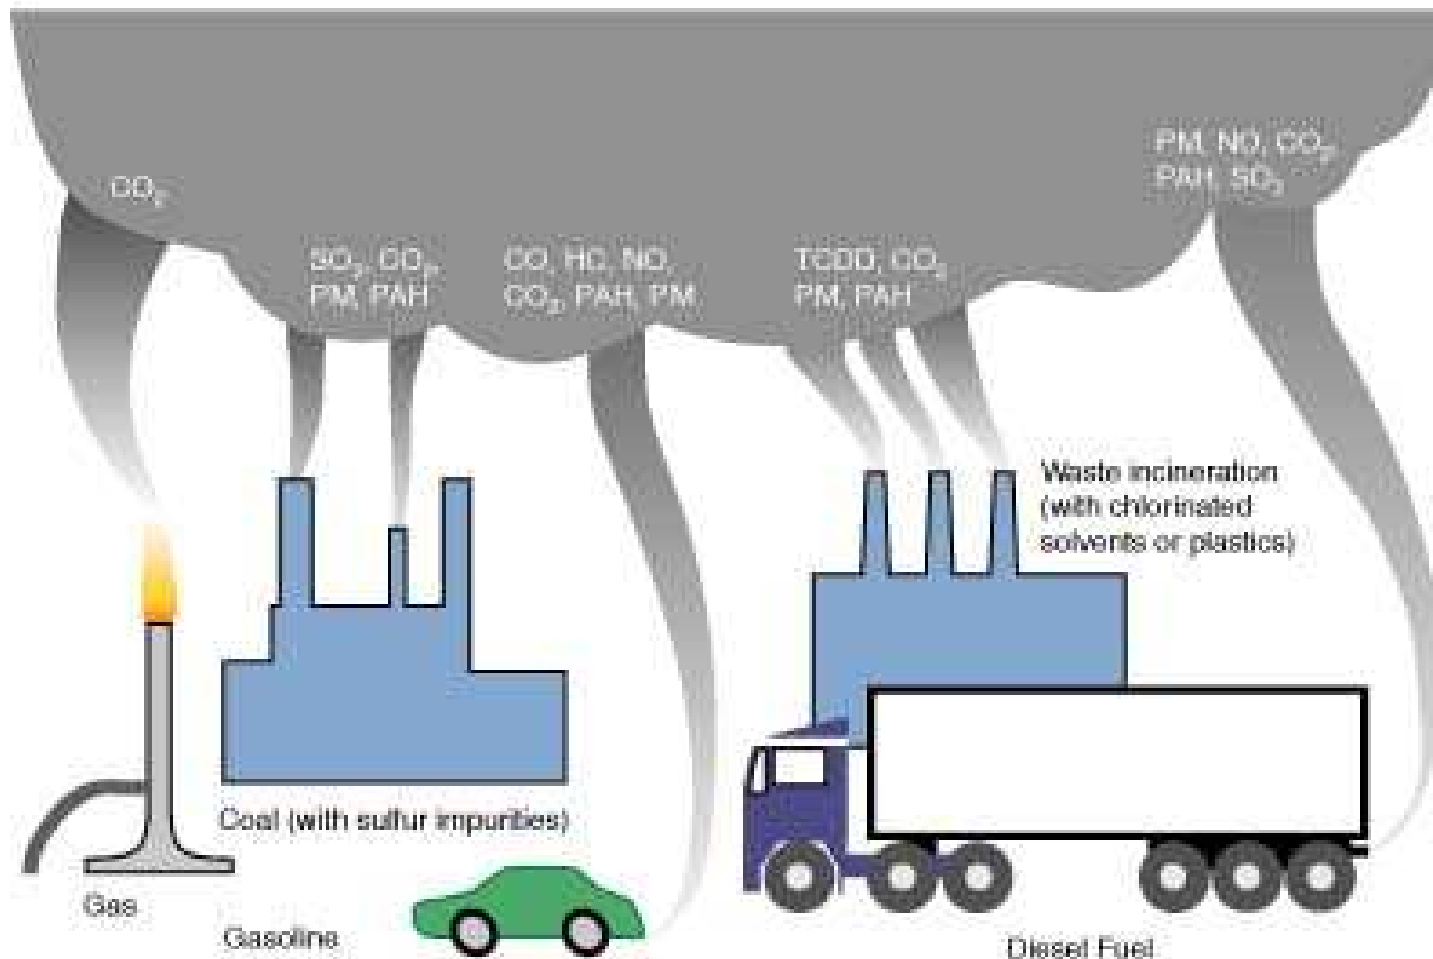

# Integrated Air Quality

- ❑ Air quality is made up of many different substances, from many different locations and source types.
  - Many small local sources
  - Large sources far, far away.
  
- ❑ We do not know which are the dominate sources or how they impact the airshed!

# Contributions to an Airshed

## Study Objective

- ❑ What are the origin of the emissions that contribute to Toronto's air quality?
- ❑ What is the cumulative concentration of local and transboundary sources?
- ❑ What is he health impact of these emissions?

## Decisions

- ❑ Selection of contaminants of known or suspected concern that influence the airshed.
- ❑ Selection of an appropriate air quality modelling system
- ❑ Determination of the size and extent of the surrounding domain which contributes to the airshed of interest.

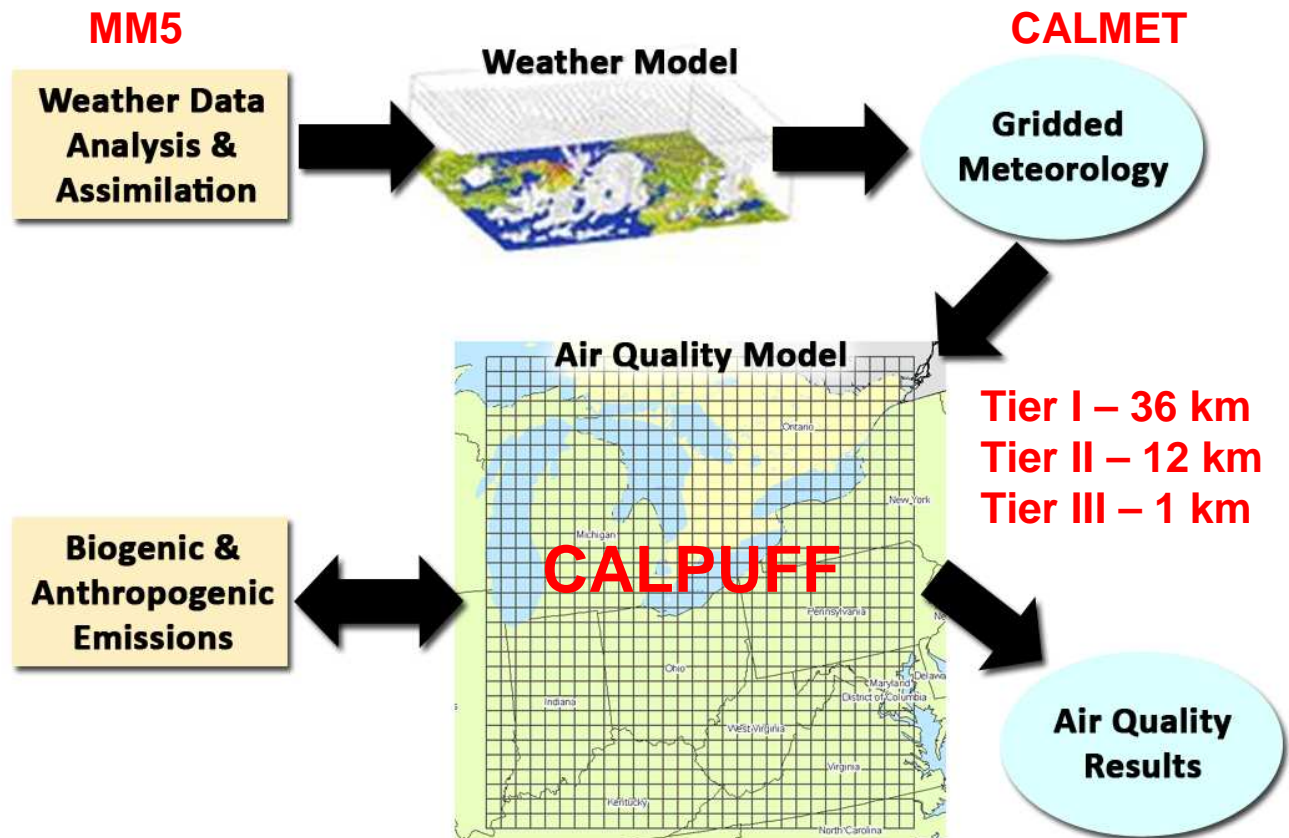

# List of Priority Air Contaminants

1. Acetaldehyde
2. Acrolein
3. Benzene
4. 1,3-Butadiene
5. Cadmium
6. Carbon tetrachloride
7. Chloroform
8. Chloromethane
9. Chromium
10. 1,4-Dichlorobenzene
11. 1,2-Dichloroethane
12. Dichloromethane
13. Ethylene dibromide
14. Formaldehyde
15. Lead
16. Manganese
17. Mercury
18. Nickel compounds
19. Nitrogen Oxides
20. PAHs (as B[a]Ps)
21. PM<sub>2.5</sub>
22. Tetrachloroethylene
23. Toluene
24. Trichloroethylene
25. Vinyl Chloride
26. Carbon Monoxide (CO)
27. PM<sub>10</sub>
28. Sulfur Dioxide
29. VOC (anthropogenic/Biogenic)
30. Ozone

# Toronto Airshed Modelling System

# Approach

- ❑ Three Tiered System
  - Tier 1 – 36 km Grid - United States Emissions
  - Tier 2 – 12 km Grid - Ontario Emissions
  - Tier 3 – 1 km Grid - City of Toronto Emissions Only
  
- ❑ Evaluate the impact of each grouping on a community of interest independently
  
- ❑ Effectively determining the cumulative contribution of all sources on a community

# Gridded Meteorological Data

- ❑ The Toronto met data was prepared using MM5 and then downscaled using CALMET
  
- ❑ MM5 was execute on three nested domain
  - 108 km ,36 km and 12 km
  
- ❑ Runs for nest number 2 and 3 uses warm starts
  - i.e., both nest starts 24hrs after the mother domain
  - FDDA/analysis nudging was used only for mother domain
  
- ❑ **TIER I - CALMET for 36 km Resolution**
  - Initialized using 36km MM5 data
  
- ❑ **TIER III/III – CALMET for 12 km/1 km Resolution**
  - Initialized using 12km MM5 data

# Wind Vectors – Summer vs SMOG

June - August 2006 - Average Value

# Emission Data

## □ TIER I –

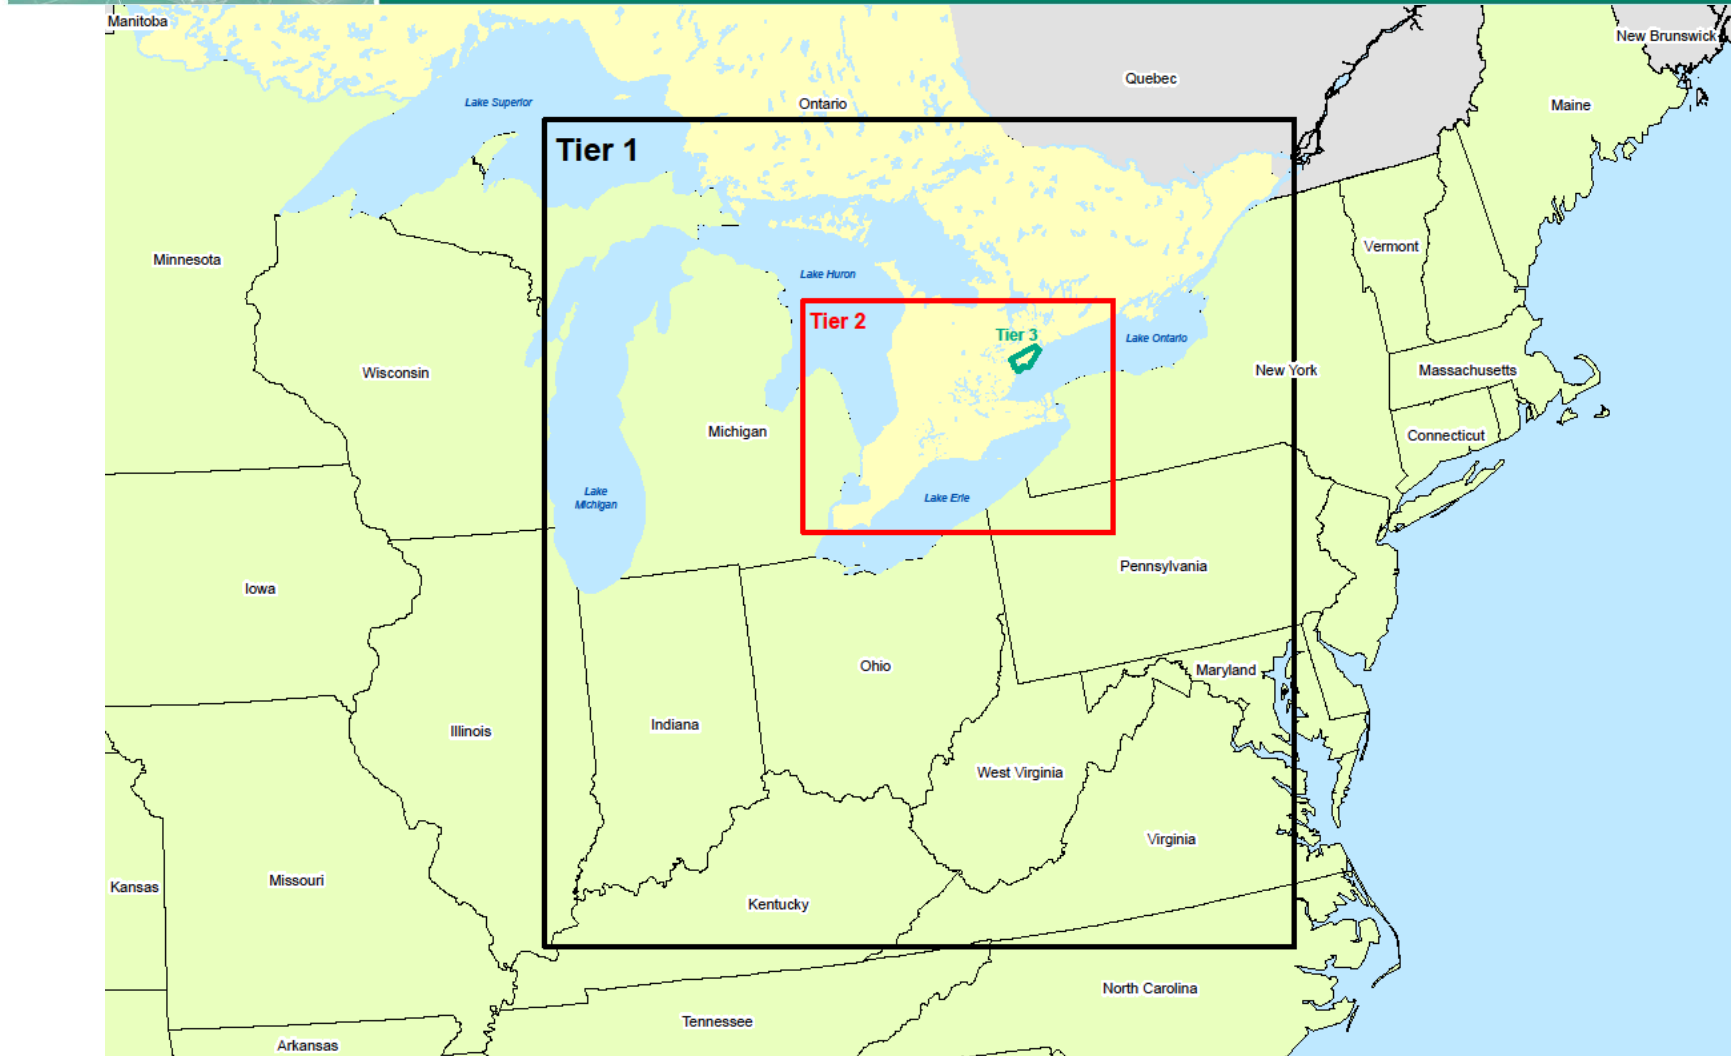

- SMOKE provided the temporal and spatial emission
- Used 2002 QA/QC Emission Inventory
- Processed with AirTool to generate CALPUFF ready hourly files
  - Industrial
  - Commercial and Residential
  - Mobile
  - Nonroad

## □ TIER II/III –

- AirTool emission processor to create CALPUFF ready files
  - Based on 2006 emission/activity data
  - Industrial Points (NPRI)
  - Commercial and Residential (commercial and residential natural gas usage, autobody shops, dry cleaners, commercial solvents, other residential heating sources)
  - Mobile (on-road vehicles)
  - Non-road (airport, marine, rail, lawn mowers, agricultural vehicles)
  - Biogenic and Agricultural

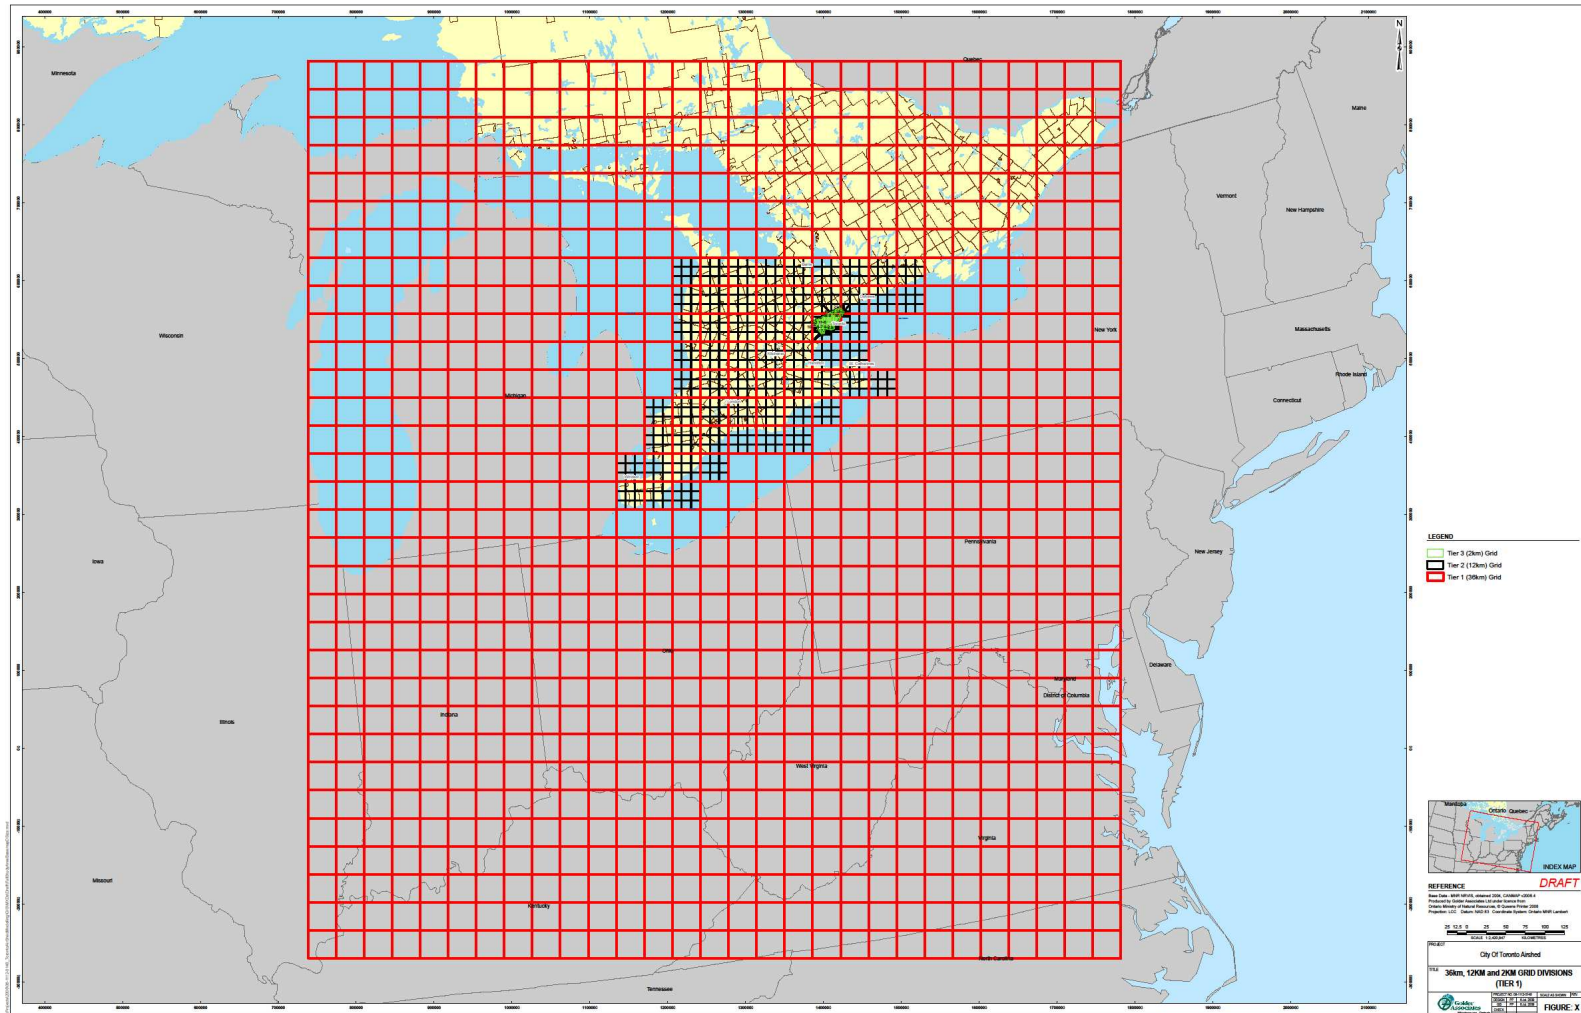

# Three Tier Domains

# Tier 1 – US Domain

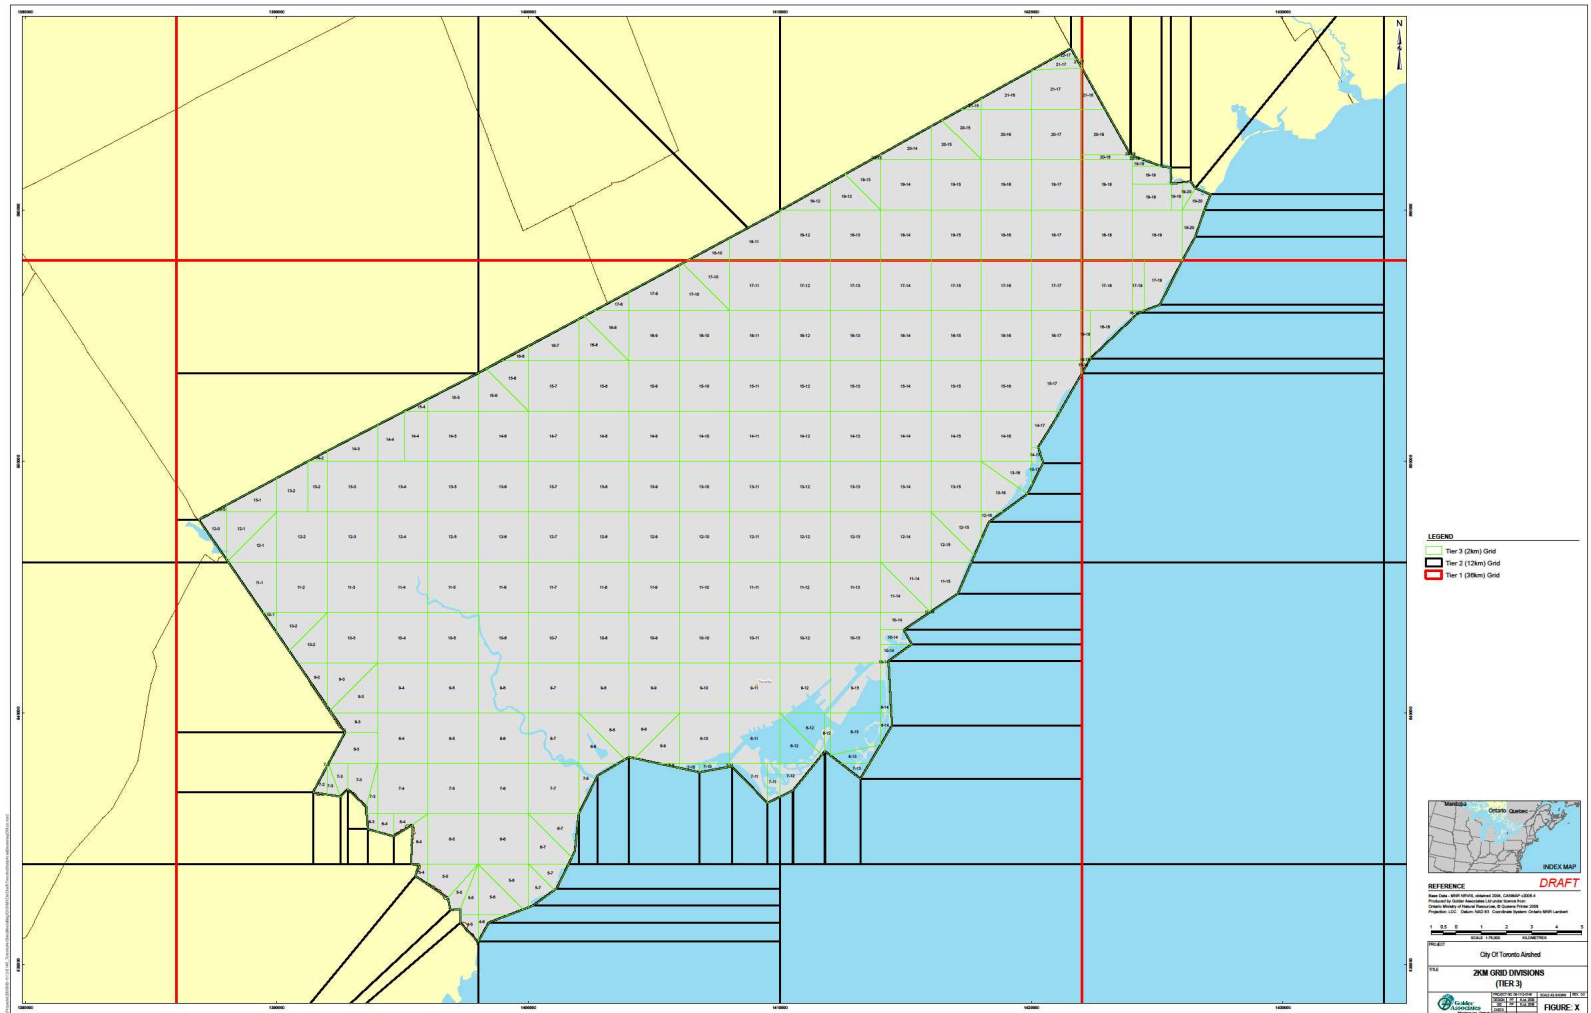

# Tier II – Ontario Domain

# Tier III – Toronto Domain

# Distribution of Emission Sources

### Tier III Percent Distribution of Emissions

### Tier II Percent Distribution of Emissions

### Tier I Percent Distribution of Emissions

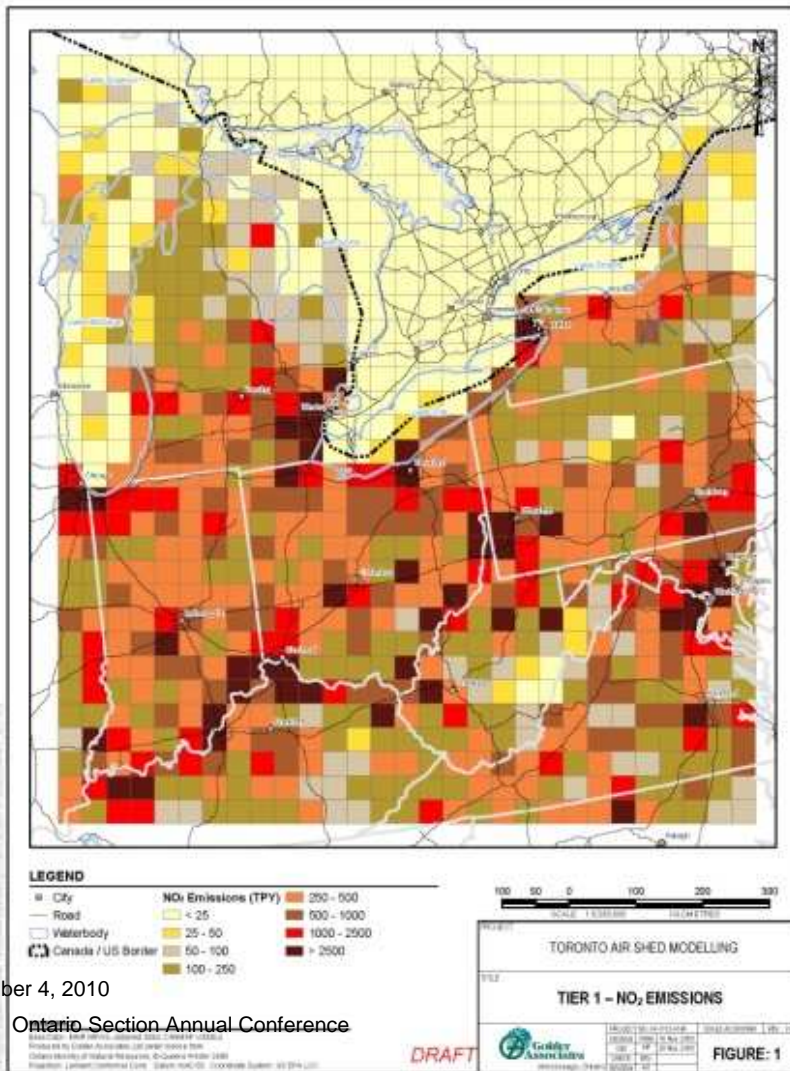

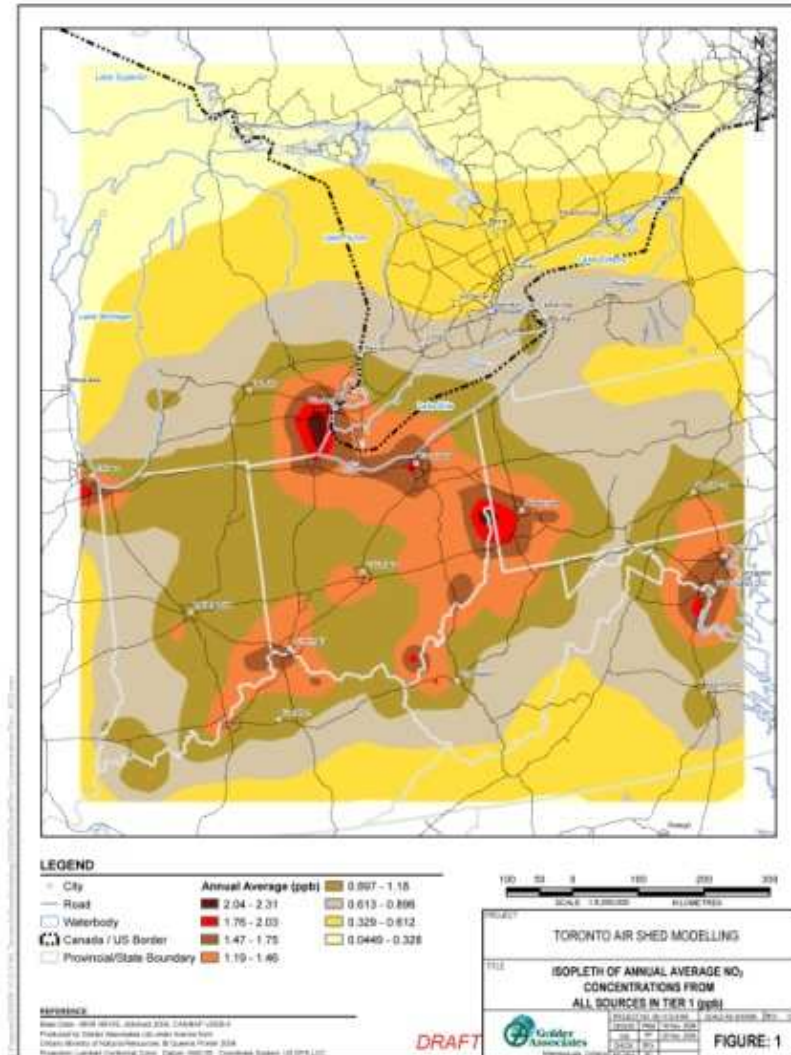

# NO<sub>x</sub>/NO<sub>2</sub> – TIER I

## Annual Emissions (T/a)

## Annual Concentrations (ppb)

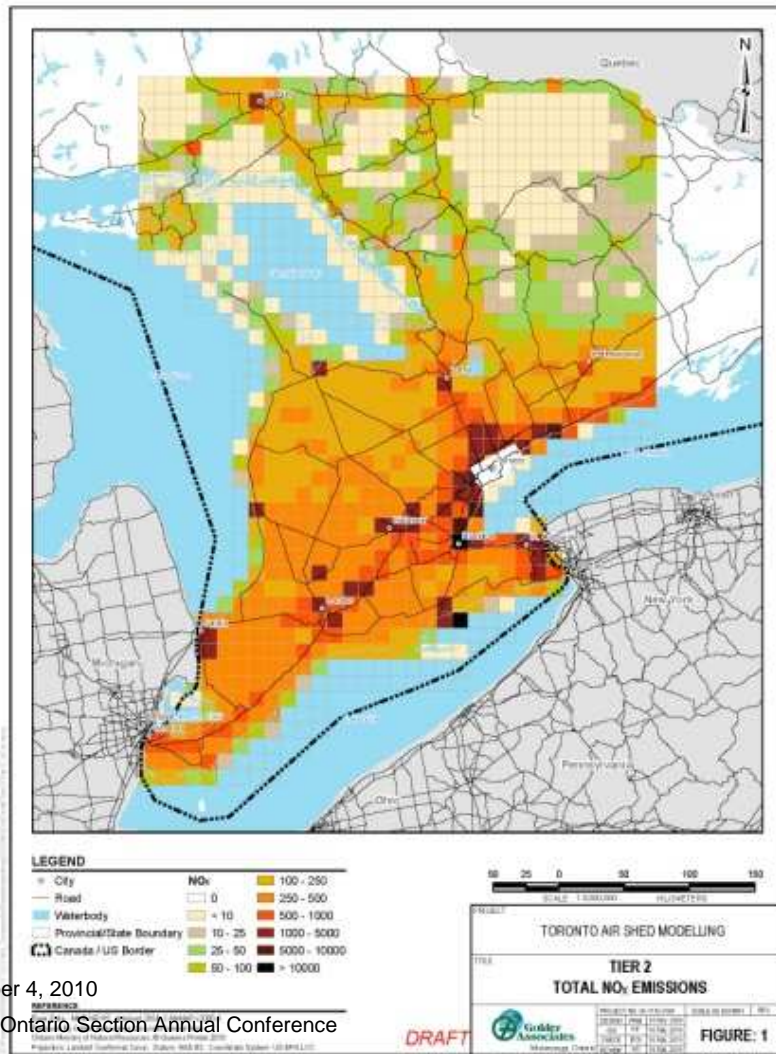

November 4, 2010  
AWMA Ontario Section Annual Conference

20

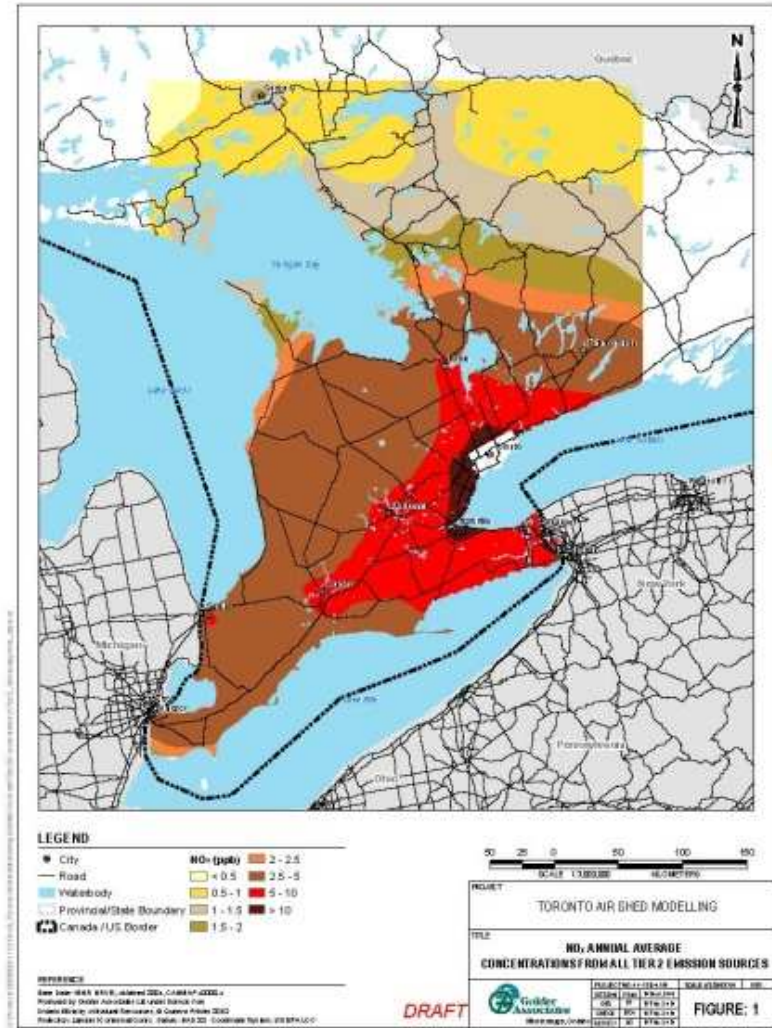

# NO<sub>x</sub>/NO<sub>2</sub> – TIER II

## Annual Emissions (T/a)

## Annual Concentrations (ppb)

# How Good Are The Results?

Sampling Cell or Location	Units	Modelled				Monitored	
		Tier III 20_22	Tier II 19_22	Tier I 22_18	Cumulative	MOE Monitor Toronto Downtown (31103) Bay /Wellesley	NAPS Monitor <sup>(3)</sup> Toronto Downtown (060427) 223 College St
Nitrogen Oxides	ppb	34.0	9.5	8.6	52.1	26.1	—
Carbon Monoxide	ppb	178.5	42.9	45.7	267.1	325.5	—
Sulphur Dioxide	ppb	0.5	1.3	4.8	6.6	1.9	—
PM <sub>2.5</sub>	µg/m <sup>3</sup>	4.0	1.4	2.0	7.4	7.3	10 ± 8
PM <sub>10</sub>	µg/m <sup>3</sup>	11.6	3.4	4.6	19.6	—	15 ± 11
1,3-Butadiene	ppb	0.029	0.010	0.007	0.046	—	0.04 ± 0.04
Benzene	ppb	0.17	0.05	0.06	0.28	—	0.30 ± 0.15
Toluene	ppb	1.12	0.20	0.27	1.59	—	1.12 ± 0.91
Lead	µg/m <sup>3</sup>	0.000	0.001	0.001	0.002	—	0.002 ± 0.002
Dichloromethane	ppb	0.045	0.009	0.008	0.062	—	0.19 ± 0.11
Tetrachloroethylene	ppb	0.039	0.009	0.004	0.051	—	0.042 ± 0.028

## Next Steps

- ❑ Toronto Health evaluating the health impact
- ❑ Cumulative dosage of combining the air contaminants based on carcinogenic and non-carcinogenic
- ❑ Analyzing source contribution of vehicle, industrial, commercial

# Summary & Conclusions

- ❑ Daily and Annual integrated concentrations for 29 species have been realized
- ❑ Emissions distribution in domain
  - US Domain -90%
  - Ontario -9%
  - Toronto -1%
- ❑ Concentration contribution to Toronto
  - US - 38%
  - Ontario -24%
  - Toronto -38%
  - but highly dependent on species
- ❑ Cumulative evaluation for multiple contaminants demonstrates there is no silver bullet ...
- ❑ Local sources tend to dominant most important species
